QuietMel Quick Start

A short guide to opening the map, checking crowd conditions and finding a quieter place.

Built for quieter decisions

QuietMel combines pedestrian activity, place search and walking routes in one map-first experience.

Start with your location

1

Allow location access

Your browser asks before QuietMel uses your device location. Choose Allow to enable nearby places and routes from your current position.

2

Check the map

The default heatmap shows the latest available pedestrian activity around Melbourne.

3

Refresh when needed

Use the round refresh control near the lower-right map controls to request the latest crowd snapshot.

Choose what the map shows

1

Open map details

Use the layers control to switch between Heatmap, Sensors and Combined views.

2

Inspect a sensor

In Sensors or Combined view, select a map marker to see its location name and current count.

3

Preview the next six hours

Select Forecast to animate predicted pedestrian activity from the current time.

Find a place or route

1

Search for a destination

Open the search field, enter a start and destination, then choose a suggestion from the list.

2

Compare alternatives

QuietMel ranks available walking routes. The selected route is solid; alternatives are shown with lower emphasis.

3

Find quiet nearby

Use Find quiet nearby to locate a nearby park, library, cafe or similar place and request the fastest walking route.

Location permission

If permission is denied, features that require your current position remain unavailable. Enable location for quietmel.vercel.app in your browser settings, then try again.
