Routes and Quiet Places

Plan a walking route, compare alternatives and find a nearby place with a calmer setting.

Built for quieter decisions

QuietMel combines pedestrian activity, place search and walking routes in one map-first experience.

Plan a walking route

1

Choose the start

Keep Your location selected or type a different starting place. Location-based actions ask for permission when needed.

2

Choose the destination

Type at least two characters and select a Google Places suggestion. A typed label alone is not enough to calculate a route.

3

Find quiet route

QuietMel requests walking alternatives and ranks them using travel time, distance and predicted pedestrian exposure.

Compare route options

1

Recommended first

The highest-ranked balanced option appears first and is selected automatically.

2

Read the map

The selected route uses a highlighted solid line. Other available routes use lower-emphasis dashed lines.

3

Change route

Select another route card or line to review its duration, distance and quietness score before starting navigation.

Find quiet nearby

1

Use your current position

The feature always starts from your device location. It does not silently substitute a random or saved position.

2

Search suitable places

QuietMel looks for nearby parks, libraries, cafes, gardens and other categories associated with calmer visits.

3

Follow the fastest route

After choosing the nearest suitable place, QuietMel displays the fastest walking route returned by Google Maps.

If location is blocked

The action stops and explains that location permission is required. Open Safari or browser website settings, allow Location for QuietMel, then run the action again.
